

1

DO YOU WANT
TO VISUALIZE
YOUR
PROPERTY?

2

DO YOU WANT TO
KNOW HOW TO GET
FREE SPATIAL DATA
OVER YOUR
PROPERTY?

3

HAVE YOU HEARD
OF GEOGRAPHICAL
INFORMATION
SYSTEMS (GIS)?

GIS IN THE OPEN

A PRACTICAL SPATIAL WORKSHOP FOR NON-TECHIES

You will get enough practical knowledge to create maps yourself and information on how you can get more done by applying spatial techniques.

- ✓ The Far North GIS User Group (FUNGIS) is organising a weekend program at Woodleigh Station near Ravenshoe from 28th to 30th of November 2014.
- ✓ Join Us and get on the road to technology that will improve your productivity!

Do you think
utilizing GIS
will cost you
lots of \$\$\$?

How about only
\$250 upwards
to learn the essentials
in a weekend?

The Far North GIS User Group (FUNGIS) is a volunteer group established over 25 years ago. We are Geographical Information System (GIS) Officers and Surveyors, that want to help promote the application of spatial knowledge to problem solving.

A geographical information system (GIS) is a computer system designed to capture, store, manipulate, analyse, manage, and present all types of geographical (aka spatial) data. It is a tool to visualize data in several different ways in order to see patterns and relationships in a given area or subject. These patterns generally appear on maps but they can also be found on globes or in reports and charts.

A commercial software system used to be required to present data collected by downloading spatial data or integrating GPS collected data and related information. This has meant expensive training courses, purchasing software licenses and data. Commercial software can cost thousands of \$'s. Fortunately, open software and data is now available to fulfill at least the basic requirements, and what's better - it's absolutely FREE.

This workshop will show attendees who have no prior experience with spatial sciences, GPS units or GIS systems, how to use freely available software and data. Maps produced can be anything from recording where someone has been on their property to identifying the spread of weeds, fire management, optimum positions for trapping feral animals or counting grass to uncover the most economical and sustainable grazing system for a property. All we need is a weekend of your time. All you need is a laptop computer and the desire to learn.

Volunteer programmers have built an open source mapping software system - Quantum GIS.  can be downloaded and installed on most desktop computers and tablets (  Linux  MacOS ). Assisting QGIS is the open data policies of governments worldwide. State, Federal and local governments have released terabytes of open data to help the general community to make better decisions through spatial analysis.
